

Power BI Component

- ① Report ② Table/Data ③ Model ④ DAX Query
 ⑤ Power Query Editor ⑥ Visuals

① Load/Connect data

Power Query Editor → Transform Data — { transform
 ↳ table Data source setting
 (change data source)

- delete/copy ✓
- rename ✓
- Enable/Disable : whether to load or not to power bi desktop
- * Duplicate : if you delete anything from duplicate table → original will not get affected (No change)
- Reference ↳ original will also change

⇒ (Power Query Editor uses M-language)

⇒ use first row as header, when it is first row of query.

→ Right click on columns

- Rename / Delete / Datatype
- Replace / fill
- Remove errors/duplicates

→ Add Column (Tab)

- Asc col
- Conditional col
- Custom col

ETL → Extract Transform Load

Power Query Editor → extract → transform → load to desktop

① Home (Table) ② Transform (Existing col) ③ Add Column (New Col) ✓

View Tab → will help us to identify issues with columns.

- 1) Column Quality
- 2) Column Profile

→ After checking col

- Replace
- fill
- Remove duplicates (select whole data)
- Remove errors.
